Jusuru Life Blend™ is a delicious liquid nutraceutical that promotes healthy aging, active joints and younger-looking skin.

Jusuru Life Blend provides a unique and proprietary combination of science-substantiated ingredients and antioxidant-rich phytonutrients that synergistically support a healthier life. Only Jusuru Life Blend contains multi-patented Liquid BioCell™, containing constituents such as collagen, hyaluronic acid (HA) and chondroitin sulfate (CS), which are essential for healthy joints and skin.

Liquid BioCell™ is blended with 13 exotic, antioxidant-rich fruits from around the globe including blueberry, mangosteen, açai berry, noni and pomegranate. The phytonutrients contained in the fruits possesses multiple health-promoting, biological activities. Maintaining active joints and younger-looking skin is essential for healthy aging. The key ingredient in Jusuru Life Blend, Liquid BioCell, is a patented dietary supplement proven to improve joint and skin health. Its constituents, type II collagen (hydrolyzed), hyaluronic acid and chondroitin sulfate (depolymerized) are proteins and glycosaminoglycans (GAGs) critical for the health of these tissues.

Other key ingredients are resveratrol and 13 fruits carefully selected from around the world to provide a variety of phytonutrients including vitamins, flavonoids, polyphenols and dietary fibers. The flavor is so unique, you will remember exactly where you were the first time Jusuru touched your palate.
Studies
Jusuru Life Blend™ contains a number of health-promoting, functional ingredients. They include patented Liquid BioCell™, resveratrol and 13 fruits known to contain antioxidants, vitamins, minerals and dietary fibers. Scientific studies on individual ingredients suggest that Jusuru Life Blend can synergistically promote the overall health of aging people.

Safety
Several toxicology studies, including a 14-day acute study and a 90-day sub-chronic study, have demonstrated that Liquid BioCell™ is well tolerated up to over 30 times the recommended human dose of 30 mg/kg body weight/day (1). In a pilot clinical trial involving humans with joint health conditions, Liquid BioCell™ (2g/day) was also well tolerated during the 8-week study period (2). Resveratrol is not known to cause adverse effects in humans as a recent trial that evaluated the safety of oral resveratrol in 10 healthy volunteers found a single dose up to 5 grams resulted in no serious adverse effects (3).

Joint Health
Studies support that the functional nutrients in Jusuru Life Blend can help improve joint health by providing structurally and functionally essential molecules and also by protecting the joints from oxidative damage.

There are many different types of collagen found in the body, and type II is the most abundant (>90% of collagens) in the cartilage of the synovial joint, the most common and movable joint (4). Type II collagen forms a fibrillar network to provide tensile strength to the cartilage. Proteoglycans (PGs) such as aggrecans are another key component of articular cartilage, and comprise a core protein linked with various GAGs such as HA and CS (5).

This diagram demonstrates how Liquid BioCell™ mirrors the joint composition, a key reason why the body readily accepts it.
**Joint Health** (continued)

PGs are immobilized into the collagen fibrillar network to provide resistance to compression. The contents of these structural components and the integrity of the cartilage matrix decrease due to aging or degenerative conditions. Liquid BioCell™’s composition in terms of type II collagen and proteoglycans mirrors that of human articular cartilage and can support healthy joints by supplementing these molecules (Figure 1).

**Figure 1. Comparison of Composition of Liquid BioCell™ and Human Articular Cartilage.**

Multiple clinical studies demonstrate the safety and beneficial effects of collagen and GAGs toward various joint conditions (6; 7; 8). A double-blind, placebo-controlled trial of Liquid BioCell™ also revealed statistically significant efficacy in supporting joint health leading to a decrease in difficulty carrying out physical activities (Figure 2) (2).

**Figure 2. Reduced Difficulty in Physical Activities 8-weeks After Daily Ingestion of Liquid BioCell.**
Joint Health (continued)
Recent studies suggest several possible mechanisms of action for the joint health benefits provided by Liquid BioCell™. First, it may support the cartilage matrix of collagen fibrillar network filled with proteoglycans by providing constituent molecules, and also supplement joint fluid by providing HA, which helps lubricate the joint (9). A review published in Current Medical Research and Opinion comprehensively analyzed collagen hydrolysate studies listed in the PubMed database (8). The authors stated, “According to published research, orally administered collagen hydrolysate has been shown to be absorbed intestinally and to accumulate in cartilage.”

In order to ensure fast absorption and higher bioavailability, the three key constituents of Liquid BioCell™ are proprietarily processed. Type II collagen is hydrolyzed to have an average molecular weight of 1.3 to 1.8 kDa, while chondroitin sulfate is depolymerized. In an HA bioavailability study, subjects taking Liquid BioCell™ (1500 mg/daily) for 28 days were shown to increase steady-state HA levels in their blood as much as 60-fold (Figure 3).

Figure 3.

Second, a recent finding of the ability of hydrolyzed collagen, but not undenatured collagen, to stimulate novel biosynthesis of type II collagen from chondrocytes suggests that hydrolyzed collagen in Liquid BioCell™ may directly stimulate the only resident cells in the cartilage to produce its matrix components (Figure 4) (10). This would help maintain the tensile strength of cartilage, thereby supporting the shock absorption capability of the joint.
Joint Health (continued)

Joint support by Liquid Biocell™ is augmented by various fruit-derived phytonutrients with potent antioxidant activity. These phytochemicals contained in Jusuru Life Blend™ have been shown to have various health-promoting biological properties including antioxidant activity. Research suggests that antioxidants can support normal functions of chondrocytes, which appear to be affected by oxidative stress in the joints. First, nitrotyrosine, a marker of oxidative stress, is over-expressed in aging or degrading cartilage (11). This oxidative stress can lead to growth arrest and senescence of chondrocytes (12; 13), a manifestation of the loss of their normal function, causing in turn deterioration in the structure and function of the cartilage (14). Second, lower antioxidative capacity was observed in degraded regions as compared with the intact regions from the same cartilage. Furthermore, treatment of chondrocytes with reactive oxygen species (ROS) induced genome instability and reduction of replicative capacity and GAG production, whereas treatment with antioxidants such as ascorbic acid (vitamin C) prevented the damaging effects (15). These studies suggest that high contents of antioxidants such as vitamins, flavonoids, and polyphenols in Jusuru Life Blend may help neutralize these damaging effects of oxidative stress in aging joints.

Taken together, a variety of naturally occurring antioxidants abundantly contained in Jusuru Life Blend can support joint health by neutralizing oxidative stress, in synergy with Liquid BioCell™ in supporting normal functions of chondrocytes and cartilage matrix they produce.
Skin Health

The skin, the largest organ in the body, is the epidermis and the dermis. The dermis shares key structural components with the joint, including hyaluronic acid (HA), chondroitin sulfate (CS) and collagen (types I and III vs type II in the joint). Thus, Jusuru Life Blend™ helps support healthy and younger-looking skin through the provision of structurally essential molecules to the dermis and through protection against oxidative damage closely associated with intrinsic and extrinsic skin aging.

HA, a key component of Liquid BioCell™, is found in virtually all tissues including the skin and bodily fluids (16). Approximately one-third of HA is turned over daily by coordinated action of HA synthesis and hyaluronidases (17). HA in the skin is a major component of the dermal extracellular matrix and responsible for hydration, nutrient exchange, protection against free radical damage and regulation of cell differentiation and motility (18). As we grow older, the contents of dermal structural components decrease, resulting in disorganization or collapse of the extracellular network in the dermis (19). The molecular weight of HA also decreases, aggravating the loss of its water-retaining capability.

Studies suggest that Liquid BioCell™ can help maintain volume, density and turgidity of the skin in several ways. First, Liquid BioCell™ harbors a unique biological activity which differentiates it from other dietary ingredients and products for skin health. It inhibits hyaluronidase in a dose-dependent way (Figure 5), which has an intriguing implication related to skin health.
**Skin Health (continued)**

Hyaluronidase degrades HA, contributing to the aging process in the skin, in that shortened chain length and decreased polyanionic charge of HA weakens its ability to retain water, resulting in reduction of volume and turgidity of the skin (20). This will encourage the formation of wrinkles and fine lines. Inhibition of hyaluronidase by Liquid BioCell™ implies that ingestion of Liquid BioCell™ can support younger-looking skin from within by helping maintain healthy levels of hyaluronic acid, resulting in properly hydrated skin.

Second, a bioavailability study (Figure 3) suggests that a 60-fold increase in blood HA levels from daily intake of Liquid BioCell™ provides a pool available for the maintenance of adequate HA levels in the skin. Photoaging processes are similar to those of intrinsic, chronological aging. Dai et al (2007) showed that during photoaging, the total cell number and percentage of proliferating fibroblasts in the papillary dermis decreased in concomitance with the loss of HA from the dermis (20). Liquid BioCell™ may alleviate the effects of photoaging by supplementing HA.

Third, the HA of BioCell Collagen may help skin health in a more fundamental way. Greco et al reported that during wound healing, HA stimulated the proliferation of dermal fibroblasts responsible for biosynthesis of collagen, elastin and GAGs including HA (21; 22). Enhanced bioavailability of HA and inhibition of hyaluronidase would increase HA levels in the skin, which is postulated to stimulate dermal fibroblasts to synthesize skin collagens and other extracellular components.

Healthy aging requires an effective measure against oxidative stress in the skin because insufficient removal of reactive oxygen species (ROS) initiates or accelerates both natural and extrinsic skin aging processes by damaging DNA, proteins and cellular membrane (23; 12). Our body has endogenous defense mechanisms including enzymatic (superoxide dismutase and catalase, etc.) and nonenzymatic molecules (vitamins and glutathione, etc) (24). As one ages, however, these defense mechanisms weaken while the load of oxidative stress increases, which will accelerate skin aging. Thus, additional and constant supply of antioxidants is essential.

Hyaluronic acid and collagen are naturally occurring elements in human skin tissue and are vital for maintaining youthful skin. Used safely and effectively worldwide for years, HA can be described as a “space filler” because it provides the moisture-filled cushioning in between our cells while collagen provides the connective framework to uphold the skin tissue’s integrity. HA is especially abundant in youthful skin where it binds to water and provides volume — thereby plumping out the appearance of wrinkles and adding resiliency to skin.
Skin Health (continued)
As shown in Table 1, 13 fruits contained in Jusuru Life Blend™ provide a variety of antioxidants such as vitamins and polyphenols that can help neutralize ROS arising from normal cellular metabolism and from exogenous factors such as UV exposure, cigarette smoking and alcohol consumption (25; 26).

Phytonutrients in Jusuru Life Blend possess a wide range of biological activities.
Skin Health (continued)

Studies show that strawberries and oranges are rich in vitamin C, a powerful antioxidant that can only be obtained from food. Sunlight and environmental pollution can deplete vitamin C in the skin, causing lipid peroxidation of epidermal layers (26). Vitamin C plays another important role in maintaining healthy skin, as a cofactor required for collagen biosynthesis from dermal fibroblasts (27). Jusuru Life Blend™ offers a continuous supply of vitamin C and various antioxidants, together with structural molecules such as HA essential to skin health, all of which can help neutralize the detrimental effects of sun exposure and associated aging process.

The antioxidant capacity of Jusuru Life Blend is fortified further by carefully selected fruits from around the globe that harbor science-substantiated phytonutrients. For example, punicalagins and its hydrolysis product ellagic acid, the most abundant polyphenolic compound in pomegranate, have been shown to have potent antioxidant capacity (28). Studies also showed that pomegranate extract restored enzymatic antioxidant defense mechanisms including catalase, peroxidase and superoxide dismutase, which might explain pomegranate-induced amelioration of UVA-mediated damages and protection against the adverse effects of UVB radiation in human epidermal keratinocytes (29; 30). Similarly, anthocyanin-rich blueberry extract was shown to dampen UVB-mediated toxicity in human dermal fibroblasts through blocking NF-κB and p53 activation and through suppressing ROS-mediated expression of matrix metalloproteinases (MMPs) that could degrade skin collagen (31). These results support that polyphenolic compound-rich pomegranate, blueberry and other fruits in Jusuru Life Blend may be highly protective against UV-induced skin photoaging as well as chronological aging.

Moreover, resveratrol, which is implicated in the “French Paradox,” is also found in Jusuru Life Blend. Each serving contains the same amount of resveratrol as two full bottles of red wine. Studies showed that it had diverse biological properties in-vitro and prevented UVB damage and abnormal cell proliferation in skin whose effects appeared to be mediated through modulation of surviving (32; 33). Resveratrol administration increased the lifespans of yeast, worms, fruit flies, fish and mice fed a high-calorie diet (34), and intensive research is underway to investigate whether resveratrol has similar longevity effects in humans. Interestingly, in a recent aging study, a low dose of dietary resveratrol had altered gene expression in the heart, brain and skeletal muscle similar to that induced by caloric restriction (35).
